Safety matters with Eaton's Arcflash Reduction Maintenance System[™]

At Eaton, safety is the No. 1 priority. It is our goal not only to provide innovative solutions for our customers, but also to create products that help ensure the safety of personnel.

Eaton is improving personnel safety with its Arcflash Reduction Maintenance System technology, also called Maintenance Mode, which responds nearly three times faster when an arcing fault is present. Eaton's Maintenance Mode system works on a separate peak-sensing analog circuit to ensure the fastest fault clearing time. Other circuit breaker manufacturers address the danger of arc flash incidents by dialing down pickup settings to the Instantaneous function, so that the circuit breaker responds with no intentional delay at lower levels of arcing current.

This technology, featured in Eaton molded-case circuit breakers equipped with the 310+ electronic trip units, covers applications from 55 A through 2500 A and allows the breaker to respond more quickly to an arcing fault condition. This not only clears the fault faster, but also significantly reduces the release of potentially harmful arc flash energy.

Faster clearing time means less arc energy. Less arc energy exposure means improved worker safety.

Benefits of the Arcflash Reduction Maintenance System unit

- Increased worker safety—when enabled, the Arcflash Reduction Maintenance System trips the breaker 40% to 60% faster than the standard instantaneous trip, resulting in significant arc flash energy reduction.
- Reduction in incident energy levels due to an arc flash may allow reduced levels of personal protective equipment (PPE) to be used, increasing worker comfort and mobility.
- Using molded-case circuit breakers with Eaton's 310+ electronic trip units equipped with the Arcflash Reduction Maintenance System, an operator can enable the Maintenance Mode system remotely. When enabled remotely, the system is set at the maximum level of protection. In addition, an on-board switch on some circuit breaker frames allows the operator to manually enable
- en Maintenance Mode and change the Instantaneous setting of the trip unit for redundancy and an added level of safety. 2 The system also includes local and h remote status indications for
- Eaton 310+ electronic trip units address the National Electrical Code® Section 240.87 for Arc Energy Reduction. These molded-case circuit breakers provide two approved methods to reduce arc energy: energy-reducing maintenance switching with local status indicator and zone selective interlocking.

operator situational awareness.

- Typical tested values for Eaton molded-case circuit broakers
- All 310+ trip units with Maintenance Mode include the ability to enable remotely at a fixed setting of 2.5x. Series G LG, NG and RG breakers are also equipped with an on-board manual switch.

310+ Electronic trip unit technology available across molded-case circuit breakers

Integrated adjustable rating

The 310+ ETU offers a range of adjustability of Long (L), Short (S), Instantaneous (I) and Ground (G) settings. The 310+ contains an integrated I, switch that allows users to modify the continuous current rating of the breaker as the application demands. The eight-position I_r switch enables a multitude of continuous current settings. Ordering, stocking and managing various amperages of rating plugs is no longer required.

Adjustable curve shaping

Users of the 310+ ETU will enjoy the protection curve shaping functions enabled by the L, S, I and G adjustability. These settings are particularly useful for applications demanding breaker coordination and circuit customization. The long delay and short delay functions enable the breaker curves to be manipulated for upstream and downstream breaker coordination.

Cause of trip information

If cause of trip is desired, the

310+ ETU can be fitted with a Digiview, a Panelmount Digiview or a Cause of Trip LED indicator. When a fault condition occurs and one of these devices is connected to the ETU's test port, the 310+ processor captures the fault information and transmits to the cause of trip device before the breaker trips and goes offline. While powered via line current when the breaker is closed, the Digiview and Cause of Trip LED indicator are also equipped with a lithium battery that enables them to retain the cause of trip information when the breaker trips/opens. The Digiview is also capable of displaying phase and ground current values when the

oad is above 20% of rating.

Zone selective interlocking

310+ ETUs can be configured with zone selective interlocking (ZSI). With ZSI enabled, all molded-case circuit breakers from 15 A through 2500 A (and beyond, into Eaton's low-voltage power breaker offering) can communicate when a phase or ground fault is present. The breaker closest to the fault will override any customer-defined delay setting and open instantaneously to clear the fault, allowing line-side breakers to remain closed and online. ZSI is also a proven solution for reducing arc flash incident energy when a fault is present.

Ground fault alarm only, no trip

New to the 310+ family of trip units is the ground fault alarm (GFA), no trip feature. Critical applications may require equipment to stay online when a ground fault is present. ETUs configured with the GFA, no trip feature will notify users that a ground fault is present while keeping the breaker online.

310+ Retrofit kits for Series C

All frames, except FD and NG, have field-installable trip units. These provide an aftermarket solution to replace 310+ trip units when Maintenance Mode, ZSI, cause of trip, or GFA are desired.

Eaton molded-case circuit breakers offer a common electronic trip unit offering from 15 A through 2500 A. The Digitrip™ RMS 310+ and 210+ electronic trip units (ETUs) offer a wide range of selectable settings and optional features to fit your electrical application needs.
